Background:	Dystrophin is a large, rod-like cytoskeletal protein found at the inner surface of muscle fibers. Dystrophin is missing in Duchenne Muscular Dystrophy patients and is present in reduced amounts in Becker Muscular Dystrophy patients. The protein encoded by this gene is a peripheral membrane protein found associated with dystrophin and dystrophin-related proteins. This gene is a member of the syntrophin gene family, which contains at least two other structurally-related genes. [provided by RefSeq]
Synonyms:	dj1187J4.5; LQT12; SNT1; TACIP1

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY SNTA1 (RC204480), Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-SNTA1. Positive lysates [LY401080] (100ug) and [LC401080] (20ug) can be purchased separately from OriGene.

HEK293T cells transfected with either [RC204480] overexpress plasmid (Red) or empty vector control plasmid (Blue) were immunostained by anti-SNTA1 antibody (TA502047), and then analyzed by flow cytometry.
