Background:	This gene encodes a member of the intermediate filament family. Intermediate filaments, along with microtubules and actin microfilaments, make up the cytoskeleton. The protein encoded by this gene is responsible for maintaining cell shape, integrity of the cytoplasm, and stabilizing cytoskeletal interactions. It is also involved in the immune response, and controls the transport of low-density lipoprotein (LDL)-derived cholesterol from a lysosome to the site of esterification. It functions as an organizer of a number of critical proteins involved in attachment, migration, and cell signaling. Mutations in this gene causes a dominant, pulverulent cataract. HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY VIM ([RC201546], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-VIM. (1:2. Positive lysates [LY401165] (100ug) and [LC401165] (20ug) can be purchased separately from OriGene.

Western blot analysis of extracts (35ug) from 4 different cell lines by using anti-VIM monoclonal antibody (1:500).

Western blot analysis of extracts (35ug) from 2 different cell lines by using anti-VIM monoclonal antibody (1:500).

Equivalent amounts of cell lysates (10 ug per lane) of wild-type HeLa cells (WT, Cat# LC810HELA) and VIM-Knockout HeLa cells (KO, Cat# [LC810257]) were separated by SDS-PAGE and immunoblotted with anti-VIM monoclonal antibody TA801297, (1:500). Then the blotted membrane was stripped and reprobed with anti-HSP90AB1 antibody ([TA500494]) as a loading control.
